Real-Time Metering

Meaningful Intelligence

Customers trying to understand usage patterns, and the means to optimize it, are often frustrated by the reality that while invoices may detail consumption, it is usually well after the fact. Real-Time Metering (RTM) is a solution to this with its ability to report on usage every few minutes.

By way of our online portal, NuEnergen can report consumption either by connecting to an existing RTM or installing a new one. Our meters can be used to record data for commodities beyond electricity, including natural gas, steam and solar data.

How It Works

- We will work with you to identify what account(s) you want real-time data for, and survey the utility meters and sites in question.

- If utility upgrades are required to support the data feeds, NuEnergen will coordinate that process on your behalf.

- Once the RTMs are ready, our IT team will ensure the broadcast of RTM data to our cloud servers, and then transform the data so you can access it online.

Demand Response Application

While RTMs are useful for ongoing data review, they are also wonderful complements for customers participating in Demand Response. With RTMs in place, you can monitor your performance live during any load shed events, thereby ensuring you are optimizing your revenues.

NuEnergen supports over 1,800 real-time data streams for multiple commodities
